Create a new organization

Organizations are privately shared spaces for teams to collaborate on infrastructure. [Learn more](#) about organizations in HCP Terraform.

How will you use this organization? Not editable after creation

Business

- Best for company or institution use (even if this is just for testing for now).
- Ensures proper handling of taxes.
- Ensures business continuity by tying this organization to the business rather than individuals.

Personal

- Best for individual use for your own personal projects that have no affiliation to a business.

Terraform organization name

- Must be unique.
- May contain valid characters including ASCII letters, numbers, spaces, as well as dashes (-), and underscores (_).

Email address

The organization email is used for any future notifications, such as billing alerts, and the organization avatar, via [gravatar.com](#).

Create a new project

Projects are groups of workspaces, letting you manage settings such as policy scope or team access in bulk.

Project name

Must be unique and between 3-40 characters. It can only contain letters, numbers, inner spaces, dashes, and underscores.

1st project for learning

Project description (Optional)

This project is for learning terraform and to store the state file

256 characters allowed

Create a new Workspace

HCP Terraform organizes your infrastructure resources by workspaces. A workspace contains infrastructure resources, variables, state data, and run history. [Learn more](#) about workspaces in HCP Terraform.

Choose your workflow

Version Control Workflow

Trigger runs based on changes to configuration in repositories.

 Best for those who need traceability and transparency

CLI-Driven Workflow

Trigger runs in a workspace using the Terraform CLI.

 Best for those comfortable with Terraform CLI

API-Driven Workflow

Trigger runs using the HCP Terraform API.

 Best for those with custom integrations and pipelines

Version Control Workflow - Automatically runs Terraform when you push code to GitHub, GitLab, Bitbucket, or Azure Repos

CLI-Driven Workflow - You run Terraform from your local machine using the CLI (`terraform apply`, etc.)

API-Driven Workflow - For advanced automation via API calls or CI/CD systems like GitHub Actions, Jenkins, GitLab CI

Create a new Workspace

HCP Terraform organizes your infrastructure resources by workspaces. A workspace contains infrastructure resources, variables, state data, and run history. [Learn more](#) about workspaces in HCP Terraform.

Configure Settings

Workspace Name

AWS_ALB_Path based

The name of your workspace is unique and used in tools, routing, and UI. Dashes, underscores, and alphanumeric characters are permitted. [Learn more about naming workspaces](#) [↗](#).

Project

1st project for learning

Every workspace must belong to a single project. Projects must be named uniquely within an organization. Workspaces may be moved between projects at any time from the workspace list or settings. [Learn more about projects](#) [↗](#).

Description (Optional)

Workspace description

Tags

Use tags to correlate, organize, or filter your resources using single values or key/value pairs.

Variables

Settings >

change a sensitive variable, delete and replace it.

Workspace variables (2)

Variables defined within a workspace always overwrite variables from variable sets that have the same type and the same key. Learn more about variable set precedence [🔗](#).

Key	Value	Category	Actions
AWS_ACCESS_KEY_ID Sensitive	Sensitive - write only	env	⋮
AWS_SECRET_ACCESS_KEY Sensitive	Sensitive - write only	env	⋮

+ Add variable

Add any required variables used in your `.tf` files

Add variable

Select variable category

☐ Terraform variable
These variables should match the declarations in your configuration. Click the HCL box to use interpolation or set a non-string value.

☒ Environment variable
These variables are available in the Terraform runtime environment.

Key

key

Value

value

☐ Sensitive ⓘ

Description (Optional)

description (optional)

Add variable Cancel

Add sensitive variables such as AWS credentials:

- Key: `AWS_ACCESS_KEY_ID` → Mark as sensitive
- Key: `AWS_SECRET_ACCESS_KEY` → Mark as sensitive
